Journey 2 – Injury Reporting

1. User and goal

Amir is a resident in Paris. At around 7:40 PM, he finds an injured person near a bus stop on Rue des Lilas. He wants to report the incident so emergency services can locate the person and provide assistance.

2. Starting point

Amir has already registered and signed in to the application. He is on his User Dashboard and selects the option to report an incident.

3. Main flow in order

- **Step 1** – Amir opens his dashboard and selects the Report button.
- **Step 2** – He chooses Injury Report as the report type.
- **Step 3** – The application asks who is injured. He selects Someone else.
- **Step 4** – He enters a short description of the incident.
- **Step 5** – The application asks for the location of the injured person.
- **Step 6** – The location is taken from his device's GPS.
- **Step 7** – He selects the severity level as Critical, because the person is not moving and appears to be bleeding.
- **Step 8** – He uploads photo or video evidence of the incident.
- **Step 9** – The application checks the uploaded evidence for supported file size and format.
- **Step 10** – Before submission, the system displays a warning that a similar incident was reported nearby.
- **Step 11** – Amir checks the warning. Since he believes it is a different incident, he continues with the report.
- **Step 12** – He submits the report and receives a confirmation with Case ID PU-027.
- **Step 13** – The report is sent to support service staff with the incident details, location, severity and available evidence.
- **Step 14** – If the report matches another report, staff can combine them into one incident. Healthcare dispatch staff review the incident information and arrange for an ambulance to be sent.
- **Step 15** – Ambulance staff attend to the injured person and update the case status as assistance is provided.
- **Step 16** – Amir can view the report status through the timeline: Submitted -> Under review -> Approved -> Team sent -> Resolved. Authorised staff record a reason when marking the case as Resolved.

Self-reporting – If Amir is reporting his own injury, he selects Me instead of Someone else. He then provides his injury details and follows the same reporting process.

4. Exception and how the user continues

Amir's GPS is switched off, and he does not know the exact street number.

The application allows him to manually select the location by dropping a pin on the map.

He also adds a nearby landmark, such as "bus stop opposite the bakery", to help responders identify the location.

He confirms the location and continues submitting the report.

5. End result

Amir successfully submits the injury report and receives a case ID. Support services receive the incident information and coordinate assistance.

Amir can view the report status, while authorised staff update the case until it is resolved.

6. Screens to sketch

A. User Dashboard – Report button and existing reports.
B. Report type selection – Injury or shop damage.
C. Injury report form – Who is injured, description and severity.
D. Location selection – GPS location with a manual map pin option if GPS is unavailable.
E. Evidence upload – Add photos or videos.
F. Duplicate warning – Review a possible similar report.
G. Report confirmation – Successful submission and case ID.
H. Report details – Incident information and status timeline.
